

Rivers of Change

An international exploration of river systems around the world—their geography and hydrology, their natural and man-made systems, their use and misuse, their science and legend, their history and their future.

First expedition:

**Norwich, United Kingdom
September 15-22, 2012**

Only one percent of the water in the world is fresh water and it supplies the needs of land-bound life all around the planet. Rivers collect, concentrate, and direct this water along courses where civilizations have bloomed, declined, and reformed again and again since time immemorial. Understanding how cultures around the world regard and use their rivers enlightens us all in the stewardship of the rivers in our own countries, in our own states, and in our own communities.

Water is the source of life.

Join Resource Institute in exploring rivers of change. The first week-long exploration is September 15-22, 2012 in England. Dr Richard Hey will present introductory seminars reviewing EU river management practices and new approaches to natural river design prior to leading field excursions to restoration sites on rivers across the country.
